Abstracts

Semi open vortex pumps are a specialized type of centrifugal pump designed with an impeller that features short, widely spaced vanes and a semi-open configuration where the impeller vanes are not fully enclosed by a shroud on one side. This design enables the efficient handling of fluids containing high concentrations of solids, fibrous materials, or entrained gases, as the open structure minimizes clogging while the vortex action created by the impeller reduces direct contact between solids and pump components, thereby reducing wear. They are distinguished from fully open or closed impeller designs by offering a balance of debris-handling capability and moderate efficiency, making them suitable for applications where pure open impellers might lack durability or closed impellers would be prone to blockage.

The global Semi Open Vortex Pumps market size was estimated at USD 312.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
