Abstracts

Semi-refined paraffin wax is a petroleum-derived, partially purified solid hydrocarbon product characterized by its white to off-white color, low oil content (typically between 1-3%), and semi-crystalline structure, featuring a melting point range of 52-62°C that renders it suitable for applications requiring moderate thermal stability, pliability, and water resistance without the stringent purity demands of fully refined variants. It is produced through slack wax de-oiling and partial bleaching, retaining trace impurities and a slight odor, making it cost-effective for industrial uses where high aesthetic or olfactory standards are secondary to functional performance, such as in candle manufacturing, rubber and tire production, corrugated board sizing, and as a moisture barrier in packaging and construction materials.

The global Semi Refined Paraffin Wax market size was estimated at USD 3200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
