Abstracts

Semi-shielded inductors are passive electronic components designed to provide inductance while partially containing magnetic flux through the use of a magnetic core that is open on one or more sides, offering a balance between the compact size and cost-effectiveness of unshielded inductors and the superior electromagnetic interference (EMI) suppression of fully shielded types. These components are widely used in power supply circuits, DC-DC converters, and noise filtering applications where moderate magnetic field containment is sufficient to meet regulatory standards and prevent interference with adjacent circuitry, without the added bulk or expense of full shielding.

The global Semi Shielded Inductor market size was estimated at USD 650.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
