Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Semi-Steel Radial OTR Tires competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Semi-Steel Radial OTR Tires are a type of tire that combines radial tire structure with partial steel cord reinforcement technology. They are designed for off-the-road (OTR) applications such as construction, mining, and agriculture. Semi-Steel Radial OTR tires include carcass layers, belt layers, and cord radial structures. They are suitable for heavy-duty engineering vehicles such as loaders, cranes, mining machinery, and concrete equipment. They have properties such as cut resistance, tear resistance, and high temperature resistance. The carcass cords are arranged in a radial direction (90 degrees to the rolling direction of the tire), and the belt layer is circumferentially wound with steel cords to form a high-strength, low-deformation skeleton structure. This design significantly improves the tire's load-bearing capacity, wear resistance, and puncture resistance. The carcass part uses fiber materials (such as polyester, nylon, etc.), while the belt layer or crown area is reinforced with steel cords. This "semi-steel" structure reduces the weight of the tire while ensuring strength, improving handling and comfort.

The global Semi-Steel Radial OTR Tires market size was estimated at USD 2541.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
