Report Overview

Semiconductor Ball Mounting is a piece of equipment in semiconductor manufacturing, mainly used to permanently connect wafers of different materials. As part of the back-end engineering of semiconductor production, bonding metal wires and ceramic riving knives are used to perform ball bonding on the electrodes in the chip before wafer cutting, and the wire tails are cut to form protruding electrodes (threads). pillar bump) process. After the ball is planted, the protruding electrodes of the chip are connected through the key flip chip process to form an electronic circuit.
