Abstracts

A Semiconductor Capacitance Diaphragm Gauge (CDG) is a high-accuracy vacuum pressure sensor widely used in semiconductor manufacturing and other precision industrial applications. It measures pressure by detecting the deflection of a thin, corrosion-resistant diaphragm (typically made of ceramic or metal) through changes in capacitance between the diaphragm and a fixed electrode. As pressure varies, the diaphragm flexes, altering the capacitance, which is then converted into an electrical signal for precise pressure readings. CDGs offer excellent linearity, stability, and gas-independent performance across a broad pressure range (e.g., from milliTorrr to atmospheric pressure). They are particularly valued in semiconductor processes like etching, CVD, and PVD due to their fast response, low power consumption, and resistance to harsh environments. Advanced models feature temperature control, digital communication interfaces (e.g., EtherCAT, PROFIBUS), and diagnostic capabilities for enhanced reliability in critical vacuum systems.

The global Semiconductor Capacitance Diaphragm Gauge (CDG) market size was estimated at USD 74.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
