Report Overview

Semiconductor capital equipment is machinery used in the production of semiconductor devices. Equipment for manufacturing semiconductor devices is classified as front-end or back-end based on the processes used. Front-end includes wafer fabrication along with other functions such as lithography, deposition, etching, cleaning, and chemical and mechanical polishing to name a few. Back-end encompasses assembly, packaging, and testing of ICs. Semiconductors are the building blocks for electronics. They form the crucial core of any electronic component. Semiconductor capital spending essentially refers to the capital investments by vendors in the semiconductor domain.

Owing to benefits such as the smaller footprint and increased potential yield and the ability to provide a higher throughput since the IC is packaged while it is still a part of the wafer, the semiconductor capital equipment vendors primarily prefer the wafer-level technology.
