Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Semiconductor Cleanwiper competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Semiconductor Cleanwiper refers to a specialized wiping material used in ultra clean environments such as wafer fabs and testing plants to wipe and remove particles, metal ions, and organic residues from equipment surfaces, process tables, pipeline interfaces, and wafer peripheral carriers. It is generally made of low emission fibers such as polyester filament, nylon, or ultrafine fibers, and is made through specialized weaving, ultrasonic or laser edge sealing, multiple ultra pure water cleaning, and clean packaging. It has the characteristics of extremely low chip shedding, low ions, low volatile organic compounds, good liquid absorption, and is not easy to scratch precision surfaces. It is one of the most consumed and frequently used basic consumables in semiconductor cleaning systems. In 2024, global Semiconductor Cleanwiper production reached approximately 42.36 K MT, with an average global market price of around US\$ 12,356 per MT. The upstream mainly consists of high-quality polyester filament and nylon ultrafine fiber, cellulose pulp, functional finishing agents, as well as specialized weaving equipment, ultrapure water systems, and cleaning and drying equipment. The midstream is the weaving, cutting and sealing of dust-free cloth, multiple cleaning and clean packaging with ultrapure water, forming semiconductor specific dust-free cloth of different grades and specifications. The downstream is concentrated in wafer manufacturing plants, packaging and testing plants, panel plants, and some high-end electronic assembly plants, used for equipment surface wiping, process table cleaning, product surface particle and chemical residue removal; From the perspective of cost structure, raw material fibers and chemical treatment agents usually account for about 40% of the total cost, weaving and cutting

edge sealing processing account for about 25%, multi-stage ultrapure water cleaning, drying, and clean packaging account for about 20%, equipment depreciation, plant and clean room operation energy consumption, and labor and management costs account for about 15% in total. High end products reduce scrap and pollution risks downstream by improving yield and reducing particle and ion residues, thereby supporting their relatively higher unit price and stable profit margins.

The global Semiconductor Cleanwiper market size was estimated at USD 523.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
