Report Overview

During the process of semiconductor device fabrication, the different processing steps fall into four broad categories, namely deposition, patterning, removal, and modification of electrical characteristics. The process that grows, coats, or transfers a material onto the wafer is known as deposition.

The foundries segment dominated the market and accounted for a market share of close to 60% in terms of revenue. The increasing demand for electronic devices, especially from developing APAC countries, is likely to bolster the demand for semiconductor devices such as logic, analog, memory, discrete, and sensor devices over the forecast period. To meet the rising demand, foundries need to upgrade equipment manufacturing units and ensure high throughput; thus, fuelling the demand for deposition equipment over the next four years.
