Report Overview

A vacuum pump is a device used to generate, improve and maintain a vacuum environment according to a certain working principle. It is an indispensable product that directly affects the performance and quality of vacuum complete equipment. Dry vacuum pumps are non-contact vacuum pumps that do not use oil or seals. In order to control the manufacturing process to smaller dimensions, it is increasingly necessary to perform more semiconductor manufacturing process steps with greater precision and uniformity. To achieve this, semiconductor processes must operate in an extremely controlled vacuum environment. At present, vacuum pumps have been widely used in many process links of semiconductor manufacturing, including etching, coating, diffusion and so on.

The global Semiconductor Dry Vacuum Pump market size was estimated at USD 1188 million in 2023 and is projected to reach USD 2537.91 million by 2032, exhibiting a CAGR of 8.80% during the forecast period.
