Abstracts

Semiconductor electroplated blades are precision cutting tools used in the semiconductor industry for dicing or slicing semiconductor wafers into individual chips or dies. These blades are made by electroplating abrasive materials—typically diamond particles—onto a metal core, creating a thin, durable cutting edge. The electroplating process allows for precise control over the distribution and bonding of the abrasive particles, resulting in blades that offer high cutting accuracy, minimal chipping, and reduced kerf loss. They are widely used in applications involving hard and brittle materials such as silicon, sapphire, and gallium arsenide.

The global Semiconductor Electroplated Blades market size was estimated at USD 59.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
