Abstracts

Encapsulants are materials used to encase or encapsulate semiconductor chips or dies within a protective housing or package. They are typically applied in liquid form and then cured to form a solid, protective layer around the semiconductor device. Underfills are materials applied beneath semiconductor chips or dies after they have been attached to a substrate, such as a printed circuit board (PCB) or a lead frame. Underfills are typically dispensed in liquid form and then flowed beneath the chip, filling the gap between the chip and the substrate. After dispensing, the underfill material is cured to form a solid, mechanically stable bond between the chip and the substrate.

The global Semiconductor Encapsulants Underfills market size was estimated at USD 3642.99 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
