Abstracts

Semiconductor-grade chelating agents, also known as chelating agents for semiconductors, are specialized chemical compounds used in semiconductor manufacturing processes. Chelating agents function by forming stable complexes with metal ions, effectively sequestering these ions and preventing their undesired interactions with semiconductor materials and surfaces. In semiconductor manufacturing, the presence of metal contaminants can significantly impact the performance and reliability of semiconductor devices. Chelating agents play a vital role in mitigating the detrimental effects of metal impurities by binding to these ions and facilitating their removal from the semiconductor processing environment.

The global Semiconductor Grade Chelating Agent market size was estimated at USD 125.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
