Abstracts

Semiconductor hexapods are highly specialized robotic systems designed for precision positioning and motion control in semiconductor manufacturing processes, utilizing a parallel kinematic structure with six independently controlled actuators (struts) that enable six degrees of freedom—three translational (X, Y, Z) and three rotational (pitch, roll, yaw). These systems are engineered to achieve sub-micron and nanometer-level accuracy, critical for applications such as photolithography alignment, wafer inspection, mask alignment, and micro-assembly, where stability, repeatability, and minimal vibration are essential. They are distinguished by their ability to provide complex multi-axis adjustments in a compact form factor, making them indispensable in cleanroom environments for enhancing yield, throughput, and precision in the production of integrated circuits and other microelectronic devices.

The global Semiconductor Hexapods market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
