## Abstracts

A Semiconductor Laser Scribe Machine is a vital tool used in the process of singulating, or separating, individual die (integrated circuits) from a larger silicon wafer during integrated circuit (IC) manufacturing. The Semiconductor Laser Scribe Machine market is experiencing significant growth, driven by several key factors:

- 1. Rising Demand for Integrated Circuits (ICs):** The ever-increasing demand for electronic devices like smartphones, laptops, and Internet-of-Things (IoT) gadgets translates directly to a growing need for ICs. As chip complexity increases, more die (individual circuits) are placed on each wafer. Laser scribing becomes crucial for efficiently separating these die from the larger wafer.
- 2. Miniaturization and Advanced Packaging:** The trend towards smaller and more powerful ICs necessitates precise singulation techniques like laser scribing. Advanced packaging technologies, like Fan-Out Wafer-Level Packaging (FOWLP) and Package-on-Package (PoP), involve stacking multiple die. Laser scribing offers the necessary control and flexibility for singulation in these scenarios.
- 3. Advantages of Laser Scribing over Dicing:** Compared to traditional dicing (sawing), laser scribing offers several advantages:
  - Higher Precision:** Laser beams create cleaner and more precise scribes with minimal material damage.
  - Reduced Heat-Affected Zone (HAZ):** Minimized heat generation protects sensitive circuitry within the die.
  - Flexibility:** Adaptable to various wafer sizes and die shapes

The global Semiconductor Laser Scribe Machine market size was estimated at USD 551.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
