Report Overview:

A semiconductor laser (LD) is a device that causes laser oscillation by flowing an electric current to semiconductor. The mechanism of light emission is the same as a light-emitting diode (LED). Light is generated by flowing the forward current to a p-n junction. In forward bias operation, the p-type layer is connected with the positive terminal and the n-type layer is connected with the negative terminal, electrons enter from the n-type layer and holes from the p-type layer. When the two meet at the junction, an electron drops into a hole and light is emitted at the time.

The Global Semiconductor Lasers Market Size was estimated at USD 2980.04 million in 2023 and is projected to reach USD 5136.97 million by 2029, exhibiting a CAGR of 9.50% during the forecast period.
