Report Overview

Semiconductor lithography equipment is used in the exposure phase of the semiconductor-chip manufacturing process. Semiconductor chips are created by exposing fine circuit patterns onto semiconductor substrates called wafers. Semiconductor lithography equipment uses a projection lens to reduce the circuit pattern, which is written on an original plate called a reticle, and expose the pattern onto a wafer. Each wafer is sequentially moved by using a wafer stage, and the wafer is repeatedly exposed to the circuit patterns. Because a circuit is created by overlaying many layers of ultra-fine patterns at nanometer-level precision, semiconductor lithography System must utilize ultra-high-precision technology to achieve accurate performance on this scale.
