Abstracts

The semiconductor parameter testing (analysis) system is a high-precision device specifically designed for analyzing the electrical characteristics of semiconductor devices. Its core lies in the flexible testing of multiple parameters and multiple scenarios through modular design. As a test and analysis equipment in the field of chip manufacturing, semiconductor parameter test systems are steadily expanding with the high-end and complex development of the global semiconductor industry. According to Yole data, the market size of semiconductor devices will grow to US\$672 billion in 2024. Behind this growth are the extreme requirements of emerging technologies such as 5G, AI, and autonomous driving for chip performance. With the improvement of advanced processes, the accuracy requirements for test systems are more significant. The detection of parameters such as leakage current and threshold voltage of chips with a process below 3nm requires sub-microampere current resolution. Keysight's B1500A system has achieved 0.1fA resolution. At the same time, with the rise of power semiconductors such as SiC and GaN, the test system is gradually upgraded to adapt to high-voltage and high-temperature environments.

The global Semiconductor Parametric Test System market size was estimated at USD 126.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
