Report Overview

Photoresist stripping equipment is used to remove the residuals of photoresists from silicon wafer after it is etched during the semiconductor chip fabrication process. The equipment plays an important role in the chip fabrication process in ensuring that the silicon wafers are free from impurities.

The semiconductor photoresist stripping market was dominated by the foundries segment, which accounted for almost 58% of the total market share. This market research study reveals that the foundries segment will continue to dominate this market because of the transition of the market towards fabless models. This recent shift towards fabless models will compel IDMs to increase their order quantity to foundries, which will subsequently increase the demand for photo stripping equipment from this segment to increase production capacity.
