Abstracts

An RF (Radio Frequency) Generator is a device that produces high-frequency alternating current (AC) signals used in semiconductor manufacturing, plasma processing, and other applications. In semiconductor fabrication, RF generators provide the power necessary to sustain plasmas used in etching, deposition (such as PECVD or PVD), and ion implantation. An RF Match (or matching network) is a circuit that optimizes the transfer of RF power from the RF generator to a plasma load by minimizing reflections and impedance mismatches. The goal of an RF match is to ensure maximum power transfer by adjusting the impedance between the RF source and the plasma chamber.

The global Semiconductor RF Generator and RF Match market size was estimated at USD 1066.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
