Report Overview

A sputtering target is a raw material used to produce thin films in a technique known as sputter deposition. During this process, the sputtering target material is broken up by gaseous ions into tiny particles that form a spray and coat another material, which is known as the substrate. Sputtering targets can be circular or come in powdered form. They are used to coat different materials called the substrate, which can be glass, displays, solar cells, etc.. Sputtering targets are thin discs or sheets of a material.
