Report Overview

A semiconductor stress testing system is a device used to apply stresses such as mechanical force, temperature, and voltage to semiconductor devices and evaluate their performance and reliability. These systems typically include devices for applying stress, such as mechanical test fixtures and temperature controls, as well as sensors, measurement equipment, and data logging systems for monitoring device performance and failure. By testing semiconductor devices under various stress conditions, semiconductor stress testing systems are able to simulate the stresses that may be encountered in actual operating environments and evaluate the performance and stability of devices under these conditions. This kind of testing helps discover potential device failure mechanisms, optimize device design, and improve product quality and reliability.
