The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Semiconductor Vacuum Feedthroughs competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Ferrofluidic Vacuum Feedthroughs is a solution for transferring rotary motion into vacuum container to eliminate gas leakage and pollution, which is suitable for strict sealing requirements. Nowadays, Vacuum Feedthroughs have been widely used in many devices which require free control of feeding, such as silicon growth, target position electronic indicators, sputtering, plasma etching, chemical vapor deposition, ion migration technology and liquid crystal regeneration. It helps reduce unnecessary downtime during the process, which has special significance. Semiconductor vacuum feedthroughs are critical components designed to enable seamless transmission of electrical signals, power, or fluids across vacuum-sealed chambers in semiconductor manufacturing equipment. These devices maintain ultra-high vacuum integrity (typically
