### Report Overview:

Semiconductor wafer adhesive tape, also known as wafer scribing adhesive tape or simply referred to as wafer scribing adhesive tape, is a special adhesive tape used in the semiconductor industry to fix fine silicon wafers in place during the scribing process. One side of the adhesive tape has a strong adhesive that firmly adheres to the surface of the wafer, while the other side is typically made of a polymer film that provides support and stability during the scribing process. In semiconductor manufacturing, silicon wafers are typically divided into individual microchips through a process called scribing. The wafer is first coated with a photoresist, and then exposed to ultraviolet light through a photomask to form a circuit pattern on the wafer. The exposed area of the photoresist is then chemically etched away, leaving a circuit pattern on the wafer surface. A dedicated saw is then used to cut the wafer along these patterns into individual microchips. Semiconductor wafer tape is used to hold the wafers together during the scribing process to prevent them from cracking or breaking. After scribing is complete, remove the tape, and clean and package the individual microchips for use in electronic devices.

The Global Semiconductor Wafer Tape Market Size was estimated at USD 1265.89 million in 2023 and is projected to reach USD 1785.54 million by 2029, exhibiting a CAGR of 5.90% during the forecast period.
