Report Overview

At present, the semiconductor cleaning process mainly includes two categories: wet method and dry method. The dry method is mainly used for the ashing process of photoresist and the removal process after part of ion implantation. Wet methods are more widely used, including photoresist stripping and cleaning, cleaning after CMP, cleaning after etching, and cleaning after film deposition. Wet process analyzers are used to accurately monitor multi-component chemicals during wet processes, enabling users to maintain the concentration and ratio of chemical components in wet process solutions and prevent costs caused by non-optimal chemistry High yield loss.

The global Semiconductor Wet Process Analyzer market size was estimated at USD 380.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
