Abstracts

Semiconductors in data centers encompass a broad range of specialized chips and devices engineered to support critical workloads such as cloud computing, artificial intelligence, high?performance computing (HPC), and massive real?time data handling. This includes processors (CPUs), graphics and AI accelerators (GPUs, TPUs, FPGAs, and custom ASICs), high?bandwidth DRAM (e.g., HBM series), and advanced connectivity chips (PCIe, CXL, NVLink). These components collectively drive the massive parallel processing, low latency, and high throughput required in modern data center infrastructures. High?bandwidth memory (HBM), for instance, acts as an on?package cache for GPUs and AI ASICs, offering terabytes per second of throughput to support AI/ML workloads.Looking ahead, data center semiconductors are evolving along several key trajectories. First, workload-specific chip specialization is accelerating: cloud giants such as AWS, Google, and Microsoft are deploying custom ASICs and tensor accelerators tailored to generative AI and HPC workloads. Second, interconnect technology is advancing rapidly — standards like PCIe 5.0/6.0 and CXL enable coherent memory pooling and vastly improved bandwidth between CPUs, accelerators, and memory.Third, energy efficiency and sustainability are becoming top priorities: semiconductor designers are pivoting toward low-power architectures (such as ARM and RISC?V cores) and tighter integration with advanced cooling, power delivery, and observability techniques, aimed at maximizing computational density and reducing data center PUE.

The global Semiconductors in Data Centers market size was estimated at USD 110672.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
