Abstracts

Sensor-based ore sorting is a non-disruptive technology in mining that responds to mega-trends such as the reduction in ore grades and increasing effort to reduce the specific resource input per tonne of product produced. It is a generic term for all physical separation processes in which material properties are detected by a sensor system and subsequently rejected through an amplified mechanical, hydraulic or pneumatic process. Different sensors at various relevant positions in the process flow allow wide application in all segments of mineral production for a variety of mineral commodities, e.g. ferrous metals, non-ferrous metals, industrial minerals, coal and diamonds. The use of sensor technology for sorting enables separation according to completely new criteria and opens up new possibilities for the mining industry. Sensor-based sorting processes are separation processes that do not require process chemicals or water and have significant energy-saving potential when used to separate barren by-products before energy- and water-intensive beneficiation processes.

The global Sensor-Based Ore Sorting Machines market size was estimated at USD 440.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
