Abstracts

Sensor-Based Ore Sorting is a method of classifying and selecting ores through the use of sensor technology, with the goal of optimizing resource utilization by removing waste, low-grade ore and improving concentrate quality. In the future, the Sensor-Based Ore Sorting process may be favored by more mineral processing plants because this process can increase production capacity and reduce production costs while making use of previously low-economic benefits and low-grade ores. In addition, this process can also separate different ore types to achieve selective sorting.

The global Sensor-Based Ore Sorting market size was estimated at USD 865.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.80% during the forecast period.
