Abstracts

Self-driving car sensors encompass a multi-modal suite of hardware and software systems designed to perceive and interpret the vehicle's surrounding environment in real-time, including but not limited to LiDAR (Light Detection and Ranging), which uses pulsed laser light to create high-resolution 3D maps; radar (Radio Detection and Ranging), which detects object distance and velocity in adverse weather; cameras for color, texture, and pattern recognition (e.g., traffic signs, lane markings); ultrasonic sensors for close-range obstacle detection during parking; and inertial measurement units (IMUs) for tracking acceleration and orientation. These sensors are often integrated through sensor fusion algorithms that combine their respective strengths—such as LiDAR's precision in spatial mapping, radar's reliability in poor visibility, and cameras' contextual awareness—to form a redundant, robust perception system capable of supporting critical functions like localization, object classification, path planning, and collision avoidance, thereby forming the foundational sensory input required for autonomous driving at various SAE levels of automation.

The global Sensors For Self Driving Car market size was estimated at USD 3295.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 14.50% during the forecast period.
