Report Overview

Sensors define the ability of a device to interact with the outside world. Thanks to various sensors and sensor combinations, consumer and non-consumer devices can now automatically react to some specific conditions under which the device operates. Sensors can authenticate the user identity; enable the device to track its location, its orientation, and how fast it is moving; how healthy the user is; and under what condition the device is being used. All data tracked from various sensors can be processed in a sensor hub to determine the context in which the device is used. Not only is this information valuable for improving the user experience and for optimizing the performance of the device but it could be of paramount importance in tracking device usage patterns, which could enable the device to learn and predict future patterns of user behavior or device environment.
