Report Overview:

Parallel hybrid marine propulsion systems can use both the electric motor and the combustion engine, simultaneously or separately, for their propulsion. Both the combustion engine and the electric motor are directly connected – via a gear with a PTI (Power Take In) for an electric motor – to the drive shaft for the propeller. This gear allows power transferral between two sources. Accordingly, the electric motor, the combustion engine, or both in parallel, can power the propeller. During normal operation, the parallel hybrid marine propulsion system will typically run on both the electric motor and the combustion engine throughout the driving cycle. This in order to achieve maximum efficiency and performance. The combustion engine will run during high speed transportation. Similarly, the electric motor is ideal to use at low speeds, but can also provide extra power when required. The combustion engine's operation varies, as it is more affected by the driving cycle (or driving pattern) compared to that of the fixed rpm of the engine in a serial hybrid marine propulsion system. This often means more emissions, by comparison. That said, the batteries do not need to be as large as in a serial hybrid marine propulsion system, thereby reducing the weight of the vessel. This may also have a positive effect on its fuel consumption. Parallel hybrid marine propulsion systems are used in a variety of vessels – from leisure boats to tugboats, wind farm boats and high-speed passenger ferries.

The Global Serial Hybrid Marine Propulsion System Market Size was estimated at USD 508.05 million in 2023 and is projected to reach USD 545.74 million by 2029, exhibiting a CAGR of 1.20% during the forecast period.
