## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Serial Port Multiplexer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the production of serial port multiplexers was 1.366 million units, with an average price of US\$256 per unit. A serial port multiplexer (mux) is a device or software that allows multiple serial communication devices or ports to be accessed over a single physical serial connection. It acts as a switch, directing data from different devices to a single serial link, which is useful when a system doesn't have enough physical ports for all its serial devices. This can be done through hardware solutions using a single port to control multiple devices or by creating "virtual" serial ports over a single physical connection, often using software. The upstream supply chain for serial port multiplexers mainly includes suppliers of communication chips, microcontrollers, interface conversion chips, power modules, PCB circuit boards, and metal casings. These components determine the bandwidth, signal integrity, and anti-interference performance of the multiplexer. Upstream companies are mostly concentrated in the electronic component manufacturing sector, with representative suppliers including Texas Instruments, NXP, STMicroelectronics, and domestic companies like GigaDevice and BYD Electronics. They provide communication interface control chips such as UART, RS232, and RS485, as well as power supply regulators. With the increasing trend of miniaturization in industrial automation and communication equipment, upstream chips are developing towards lower power consumption, higher transmission speeds, and wider temperature ranges. Downstream applications are wide-ranging, mainly concentrated in industrial control systems, rail transit communication, energy monitoring, data acquisition terminals, smart manufacturing production lines, security monitoring, and power dispatching. Industrial control scenarios are the primary source of demand. In

automated production lines, PLC control cabinets, and factory buses, serial port multiplexers enable parallel communication between multiple devices, reducing serial port resource consumption and improving signal transmission efficiency. The rail transit and energy industries utilize its stable communication capabilities in high electromagnetic interference environments for multi-channel data transmission between SCADA systems, signal control, and station control systems. Security and traffic monitoring systems use multiplexers to centrally access cameras, sensors, and control terminals, improving signal integration and real-time remote control. With the development of the Industrial Internet and edge computing, serial port multiplexers are gradually being integrated into intelligent terminal nodes, with models featuring TCP/IP protocol extension capabilities becoming mainstream. Industry development trends are primarily characterized by intelligence, networking, and modularization. Equipment is transitioning from traditional hardware logic switching to intelligent management, supporting remote configuration, network diagnostics, and automatic load balancing; communication speeds are continuously improving, evolving from the traditional 115.2kbps to 1Mbps and above; simultaneously, PoE power supply, redundant power supply design, DIN rail mounting, and wide-temperature operation are becoming standard configurations. Driving factors include intelligent manufacturing upgrades, increased demand for multi-node connections in industrial communication, an increase in the number of edge acquisition devices, and a strengthening trend towards IoT gateway integration. The main obstacles are intense market competition leading to price declines, reliance on imported high-reliability communication chips, inconsistent industrial protocol compatibility, and increased deployment costs due to high system integration complexity. Single-line annual output is approximately 8,000 to 20,000 units, with a gross profit margin of approximately 28% to 38%.

The global Serial Port Multiplexer market size was estimated at USD 350.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
