Abstracts

A serration balloon catheter is a specialized medical device designed for vascular interventions, combining the functions of a standard angioplasty balloon with micro-serrated surface features to enhance plaque modification. Unlike conventional smooth balloons, these catheters employ small, controlled serrations or scoring elements embedded on the balloon surface to create controlled incisions in calcified or fibrotic lesions during inflation. This mechanism facilitates more effective plaque fracture and vessel expansion at lower pressures, reducing the risk of vessel trauma, dissection, or elastic recoil. Primarily used in treating severely calcified coronary or peripheral artery disease, the device enables safer and more predictable outcomes in complex lesions where traditional balloons may be insufficient. Its design aims to optimize luminal gain while minimizing procedural complications, positioning it as a valuable tool in advanced interventional cardiology and radiology practices.

The global Serration Balloon Catheter market size was estimated at USD 1075.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
