Report Overview

The chipset is the core of the motherboard. A motherboard's CPU, memory, major I/O device and expansion card support all depend on the chipset. When building a server/workstation, the chipset, processor and memory should be considered as a whole. The server/workstation platforms and products we mention here are geared towards personal/home/small business users, who may choose to build a server/workstation on their own. Therefore, the chipset information provided here is only a subset of the full range of server/workstation chipset products available on the market. Traditionally, the term "chipset" often refers to the two main chips on the motherboard that dictate and control most of the functions: the Northbridge and the Southbridge. The Northbridge often refers to the chip that handles communications between the CPU, memory, AGP or PCI Express and the Southbridge. The Northbridge also often includes the memory controller. The Southbridge provides connections to I/O devices, such as the PCI bus, USB, PATA, SATA and PCI Express devices. Other Southbridge functions can include the interrupt controller, real time clock, power management (ACPI and APM), SMBus and so on. Southbridge chips are usually connected to Northbridge chips. Motherboards often include other types of chips to provide additional functions, such as SCSI controller, PCI-X controller/hub and network controller chips. The words "Northbridge" and "Southbridge" are older terms, but still used in the terminology for today's server/workstation chipsets, and functions are still similar. For example, MCH (Memory Controller Hub) and ICH (I/O Controller Hub) from Intel chipsets are essentially equivalent to "Northbridge" and "Southbridge" respectively in function. The Northbridge chip's memory controller means that memory support - defined by memory type, memory channels, memory speed and memory capacity - was determined by the chipset. However, for AMD Opteron processors, the

memory controller is integrated into the CPU. Therefore, the CPU, not the chipset determines the memory support on modern AMD platforms.
