Abstracts

FCBGA (Flip-Chip Ball Grid Array), a type of semiconductor substrate, connects high-integrated semiconductor chips and substrates using flip-chip bumps, enhancing electrical and thermal characteristics. It is mainly used in CPUs (Central Processing Units) and GPUs (Graphics Processing Units) for PCs, servers, networks, and automobiles. Server FC BGA is the most technically challenging among semiconductor substrates, and only a few global companies are capable of mass production of high-end server substrates. Server CPUs and GPUs require multiple semiconductor chips to be installed on a single substrate to accommodate high performance such as improved processing power and signal speed. Therefore, server FC-BGA substrates are more than four times the size of standard FC-BGA for PCs and have more than twice the number of layers, exceeding 20 layers. As such, server FC-BGA requires advanced manufacturing technology and dedicated facilities to enhance product reliability and production yield due to the large size of the substrate and high number of layers, making it a challenging field for new entrants. Current the key players of Server FCBGA include Ibiden, Unimicron, Nan Ya PCB, Shinko Electric Industries, Kinsus Interconnect Technology, AT&S, and Samsung Electro-Mechanics, etc. Ibiden is the largest manufacturer of FCBGA substrate. The server market for data centers is expected to expand thanks to the progress of digitization, such as the spread of ICT, as well as the evolution of AI and the improvement of the level of autonomous driving. In addition to semiconductor front-end processes (IC chips), the importance and added value of the back-end processes (FCBGA substrates) are also increasing.

The global Server FCBGA market size was estimated at USD 1127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.30% during the forecast period.
