Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Servo Electromagnetic Brake competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A servo electromagnetic brake is an electromagnetic braking device installed on a servo motor or precision transmission system. It primarily achieves rapid braking and position holding of the motor shaft through electromagnetic attraction or release. It is widely used in CNC machine tools, robot joints, automated production lines, textile equipment, and elevator door operators to ensure safe and precise positioning of the system during power outages or when the system stops operating. In 2024, global sales of servo electromagnetic brakes were approximately 820,000 units, with an average unit price of approximately US\$850. The annual production capacity of a single production line was approximately 50,000 units. Upstream companies are mainly distributed in the manufacturing of electromagnetic coils, friction materials, spring steel sheets, aluminum alloy housings, and electronic control components. Downstream companies are concentrated in servo motor manufacturers, automation equipment manufacturers, robot system integrators, and precision transmission equipment manufacturers. The industry's average gross profit margin is approximately 28%. In the product cost structure, electromagnetic coil and friction sheet materials account for approximately 45% of the cost, mechanical structure and processing account for approximately 25%, electronic control components account for approximately 15%, assembly and testing account for approximately 10%, and other management and transportation costs account for approximately 5%. Servo electromagnetic brakes can be divided into two main categories according to parameters: energized braking type and de-energized braking type. According to torque, they can be divided into low torque type, medium torque type and high torque type. According to structural form, they can

be divided into single-piece type, double-piece type and combined type. Some high-end models have low noise, fast response and intelligent monitoring functions to adapt to the dynamic braking needs of different servo systems.

The global Servo Electromagnetic Brake market size was estimated at USD 697.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Servo Electromagnetic Brake market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
