Abstracts

Servo power booster is a multiple-shoe automobile brake in which the action of one part upon another as a result of the forward motion of the vehicle increases the pressure between the second shoe and the brake drum and so increases the brake's effectiveness. Servo motors and drives are used in machinery requiring precise position control. These are used in the automation of industrial processes. Servo motors and drives are used in the following fields: packaging machinery, automotive industry, food processing, healthcare industry, semiconductors and robotics. Servo motors are further subdivided by technology into brushless DC motors, brushed DC motors, AC motors, and linear servo motors. Similarly, servo drives are divided into DC servo drives, AC servo drives and adjustable speed drives. Servo motor applications are primarily used in closed loop systems, the control of which is commonly found in industrial and commercial applications. Moreover, the growth of mobile applications is driving the growth of the drives market. The widespread use of automated guided vehicles (AGVs) is a result of adoption in smart warehouses and factories. Drones, recreational vehicles, and telepresence robots are all exploring hospital corridors and skies. Almost all of them are battery operated and have limited space. Depending on their use, they may require high speed or high torque operation. Servo motors are increasingly used in harsh environments. In order to implement the concept of Industry 4.0, many industries around the world have chosen automation as an important trend. The market for these components is expected to expand significantly owing to the widespread use of servo motors and drives in robotics, medical facilities, and other fields.

The global Servo Power Boosters market size was estimated at USD 5024.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.70% during the forecast period.
