Abstracts

A Servo Rotary Indexing Table is a precision mechanical device that combines the capabilities of a rotary table and a servo system. It is designed to rotate a workpiece or a fixture to specific angular positions with high accuracy and repeatability. The servo system, typically consisting of a servo motor, controller, and feedback mechanism, drives the rotation of the table. The servo motor provides precise control over the speed, torque, and position of the table's rotation. The feedback mechanism, such as an encoder, constantly monitors the actual position of the table and sends this information back to the controller. This allows the controller to make real-time adjustments to ensure that the table rotates to the exact desired angle. Servo Rotary Indexing Tables are used in various manufacturing processes, such as assembly lines, machining operations, and inspection stations, where accurate and repeatable angular positioning of components is required. They are capable of rapid indexing, meaning they can quickly move between different angular positions, increasing the efficiency of production processes. Additionally, their high precision makes them suitable for applications where tight tolerances need to be maintained.

The global Servo Rotary Indexing Table market size was estimated at USD 539.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
