Abstracts

Session based computing is a model of computing where user sessions are centrally hosted, managed, and executed on remote servers or in the cloud, with only the graphical user interface, input, and output data being transmitted between the client device and the server. This architecture decouples the processing and storage of applications and data from end-user devices, enabling secure access to centralized resources from a wide variety of thin clients, mobile devices, or legacy hardware, while maintaining strict control over data integrity, compliance, and software deployment. It is commonly implemented through technologies such as virtual desktop infrastructure (VDI), desktop-as-a-service (DaaS), and application virtualization, and is particularly valued in industries requiring high security, centralized management, and support for remote or Bring Your Own Device (BYOD) work environments.

The global Session Based Computing market size was estimated at USD 15210.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
