Abstracts

Set retarding admixtures are chemical additives incorporated into concrete to delay the initial setting time, allowing for extended workability and placement duration, particularly in hot weather conditions, large pours, or complex formwork situations where delayed hydration is advantageous. These admixtures function by adsorbing onto cement particles, inhibiting the early formation of hydration products, and are typically composed of hydroxylated carboxylic acids, sugars, or phosphates, which interact with the aluminate and silicate phases in cement to slow down the reaction kinetics without compromising the final strength or durability of the concrete.

The global Set Retarding Admixture market size was estimated at USD 3200.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
