Report Overview

SCID (severe combined immunodeficiency) is a group of rare disorders which occurs by mutations in genes involved in the development and function of infection-fighting immune cells. A detailed medical history and physical examination of the child are usually used to diagnose severe combined immunodeficiency (SCID). To help confirm the diagnosis, additional blood tests, including a total blood cell count, may be ordered. SCID (X-linked severe combined immunodeficiency) is an inherited immune system illness that affects virtually exclusively men. Because they lack the required immune cells to fight off some bacteria, viruses, and fungi, boys with X-linked SCID are prone to recurring and persistent illnesses.
