Abstracts

Shaft hub locking devices, also known as locking assemblies or locking elements, are mechanical components used to create a secure, backlash-free connection between hubs and shafts without requiring keyways, splines, or tapered sleeves, instead utilizing frictional force generated by the radial compression of tapered rings or similar mechanisms when axial pressure is applied via screws or hydraulic tensioning. These devices are engineered to transmit high torques, moments, and axial forces while enabling precise positioning, easy mounting and dismounting, and compensation for minor tolerances in bore and shaft dimensions, making them suitable for applications where traditional connection methods are impractical, such as in heavy machinery, power transmission systems, conveyor belts, pumps, fans, and renewable energy equipment like wind turbines.

The global Shaft Hub Locking Devices market size was estimated at USD 185.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
