Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Shaft-mounted Clutch competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global sales of shaft-mounted clutches reached 1.65 million units, with an average selling price of US\$260 per unit. Shaft-mounted clutches are used for torque engagement and disengagement between the drive shaft and the drive equipment. They achieve controllable power transmission through friction plates or drum structures and are suitable for continuous and heavy-duty operations such as belt conveyors, elevators, crushers, and metallurgical rolling mills. Single-line production capacity is typically 30,000-60,000 sets per year, with an industry average gross profit margin of approximately 22-30%. The main upstream raw materials include alloy steel, friction plate substrates, and spring components, accounting for approximately 65-72% of the cost, with steel consumption per unit of product around 8-15 kg. Downstream industries primarily include mining, building materials and cement, port logistics, and metallurgical manufacturing. In the future, with the expansion of large-scale conveying systems and intelligent factories, the demand for high-wear-resistant, automatically compensated clearance, and online monitoring clutches will increase. Companies with capabilities in friction material optimization, torque control accuracy improvement, and reliability design will gain higher market share and technological barriers. New demand growth points are concentrated in high-power-density and all-weather equipment.

The global Shaft-mounted Clutch market size was estimated at USD 430.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
