Abstracts

Shafted Hall Effect Sensors are a specific type of magnetic field sensor that incorporate a physical, rigid shaft or housing around the sensing element, designed to be mechanically mounted in applications where precise and repeatable positioning relative to a magnetic target is required. Unlike bare or PCB-mounted Hall sensors, the shafted configuration provides inherent protection against environmental factors such as dust, moisture, and physical impact, while also simplifying installation by ensuring consistent alignment and gap control between the sensor and the moving magnetic component it is intended to detect. These sensors operate on the Hall effect principle, generating a voltage output proportional to the strength of an applied magnetic field, and are commonly used to detect the presence, absence, or position of magnets?often in rotary or linear motion systems?making them critical components in industries requiring robust and reliable non-contact sensing, such as automotive, industrial automation, and consumer electronics.

The global Shafted Hall Effect Sensors market size was estimated at USD 402.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.15% during the forecast period.
