Abstracts

A shaking ultrasonic cleaner is an advanced industrial or laboratory cleaning device that combines high-frequency ultrasonic waves with a mechanical shaking motion to enhance the removal of contaminants from objects. Unlike conventional ultrasonic cleaners that rely solely on cavitation bubbles generated by sound waves to dislodge dirt, this type incorporates an oscillating or shaking platform that agitates the cleaning solution and items being cleaned, resulting in more thorough and efficient cleaning?especially for complex, delicate, or densely arranged parts. It is widely used in applications requiring precision, such as in electronics, jewelry, medical instruments, optical components, and small mechanical parts, where residual particles or films must be completely eliminated without causing damage.

The global Shaking Ultrasonic Cleaner market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
