## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Sheath-core Composite Staple Fiber competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Sheath-core composite staple fiber is a type of bicomponent fiber composed of two different polymers—one forming the outer sheath and the other forming the inner core—engineered to combine distinct properties in a single fiber. Typically produced via melt spinning and then cut into staple lengths (short fibers), this structure enhances processability and functional performance in textiles and nonwovens. The sheath material often has a lower melting point, making it suitable for thermal bonding (e.g., in hot-air or calender bonding processes), while the core provides mechanical strength and durability. Common polymer combinations include PE/PP, PE/PET, or PP/PET. Sheath-core composite staple fibers are widely used in hygiene products, filtration media, insulation, geotextiles, and automotive interiors due to their softness, bonding ability, and customizability.

The global Sheath-core Composite Staple Fiber market size was estimated at USD 398.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
