Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Shell Pre-Welding Machine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The shell-in-place pre-welding machine is a key piece of equipment in the mid-stage lithium battery production process. It is specifically used to perform preliminary, localized spot welding of the battery cover and casing after the battery cell is shelled and capped. Its core function is to temporarily secure the cover using several weld points, preventing it from shifting during the next full-weld process. This ensures the precision and quality of the final seal weld, making it a fundamental component in ensuring battery structural safety. The upstream supply chain for shell-in-place pre-welding machines includes suppliers of laser and motion control systems, the midstream involves technology-intensive system integration and process debugging, and the downstream is directly tied to the rapidly expanding lithium battery manufacturing industry. Global annual production capacity is approximately several hundred units, employing a multi-product, customized production model. Due to its high level of technological integration and its direct correlation with battery production yield, its gross profit margin is significantly higher than that of conventional industrial equipment, estimated to be between 35% and 50%. By 2024, production of shell-in-place pre-welding machines is expected to reach approximately 750 units, with an average global market price of approximately US\$250,000 per unit.

The global Shell Pre-Welding Machine market size was estimated at USD 187.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
