Abstracts

The drive system of a shield machine consists of powerful motors, gears, and transmission components that provide the necessary power to move the machine forward and rotate the cutterhead. The main drive bearings support the key rotating parts in this system, such as the motor shaft, gear shaft, and propulsion components. The cutterhead is the part of the shield machine that actually does the cutting of the soil or rock. The cutterhead bearings are responsible for supporting the rotating cutterhead and withstanding the high forces and abrasives encountered during tunneling. These bearings are essential for the cutterhead's smooth rotation and ensuring the overall stability of the TBM during the excavation process.
