Report Overview

LNG storage tank is a special structure independent of the hull, and its form has a great impact on the design of LNG transportation. There are two types of tanks for LNG carriers in the world: self-supporting tank and membrane tank. The self-supporting type includes Type A and Type B, of which Type A is prismatic or called IHISPB, and is provided with a complete secondary leak proof partition to protect all goods from leakage. The patent belongs to Ishikawa Shimizu Heavy Industry Co., Ltd. of Japan; Type B is spherical and is equipped with some secondary leak proof compartments to prevent a small amount of goods from leaking. The patent belongs to KVANERNERMOS. The membrane type can be divided into two types: Technigaz and Gaz Transport. The inner wall of the former is corrugated. Its characteristics are: many prefabricated parts can be processed to shorten the shipbuilding time. Due to the thin insulation layer, the corresponding cargo loading capacity is slightly larger, but the insulation materials are expensive, and the insulation is bonded, which cannot be changed after construction. The quality control requirements are strict. The latter is made of flat INVAR steel (36% nickel steel) with a thickness of 0.7mm and a width of 500mm. Its characteristics are: many parts cannot be pre processed, but it is easy to manufacture and takes a long time to manufacture; Due to the thick insulation layer, the corresponding cargo loading is slightly smaller; The thermal insulation material is perlite with permeable gas to add more inert gas and reduce the cost of thermal insulation material. It is enclosed in the thermal insulation box and fixed with bolts. It can be changed after construction. The quality control is not very strict.
