Abstracts

Ship propulsion systems encompass the mechanical assemblies and components responsible for generating thrust to move vessels through water, ranging from traditional propeller-based systems driven by diesel engines, gas turbines, or electric motors to more advanced solutions like azimuth thrusters, waterjets, and podded propulsion. These systems are integral to maritime transportation, naval operations, offshore industries, and recreational boating, with designs varying significantly based on vessel type, size, operational requirements, and regulatory standards concerning efficiency and emissions. Key technological trends include the integration of hybrid and fully electric propulsion, the use of alternative fuels such as LNG and hydrogen, and the adoption of digitalization and automation for optimized performance and reduced environmental impact. The market is driven by global trade volumes, naval modernization programs, stricter environmental regulations, and growing demand for fuel-efficient and low-emission solutions.

The global Ship Propulsion Systems market size was estimated at USD 3437.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
